

Load testing using another server

- [Configuring an Ubuntu server](#)
- [Scripts for load testing](#)
- [Running tests](#)

Configuring an Ubuntu server

1. Install Xvfb, Xorg to work with a virtual output device

```
apt-get install xvfb -y
apt-get install x11-xkb-utils xfonts-100dpi xfonts-75dpi xfonts-scalable xfonts-cyrillic xserver-xorg-core
xserver-xorg-video-dummy alsa-base -y
```

2. Install a dummy sound card (this step may be skipped in Ubuntu 20.04 and newer)

```
apt-get install linux-image-extra-4.4.0-62-generic -y
modprobe snd-dummy
```

3. Configure a virtual video device: edit the configuration file /usr/share/X11/xorg.conf.d/xorg.conf

```
Section "Device"
    Identifier "Configured Video Device"
    Driver "dummy"
    Option "ConstantDPI" "true"
    VideoRam 192000
EndSection

Section "Monitor"
    Identifier "Configured Monitor"

    EndSubSection
EndSection

Section "ServerFlags"
    Option "MaxClients" "2048"
EndSection
```

4. Install Apache and set up SSL, if you plan to place a player test page on the same server

```
apt-get install apache2
```

5. Install Chrome

```
wget -q -O - https://dl-ssl.google.com/linux/linux_signing_key.pub | sudo apt-key add -
echo "deb [arch=amd64] http://dl.google.com/linux/chrome/deb/ stable main" > /etc/apt/sources.list.d/google-chrome.list
apt-get update
apt-get install google-chrome-stable
```

Scripts for load testing

A gz file with scripts to perform load testing can be downloaded [here](#).

The archive contains

- the player directory containing Web player scripts
- start_xorg.sh - the script to start Xorg
- loadtest.sh - the script to start tests

Scripts of the player must be available from the Apache HTML directory: place the player directory to, for example /var/www/html/tests/player. The player.html test page accepts parameters. For example:

```
http://<server IP>/tests/player/player.html?streamName=test&autoplay=true
```

The following parameters are supported

- stream name: streamName=test
- autoplay: autoplay=true
- resolution: resolution=640x480 (in this case, transcoding will be enabled on WCS server, that inscreases server CPU load)
- media playback technology: mediaProvider=WebRTC,MSE

You can also use Embed Player page directly from WCS server to test:

```
https://wcs:8888/embed_player?urlServer=wss://wcs:8443&streamName=test&mediaProviders=WebRTC&autoplay=true
```

The loadtest.sh script can accept the following parameters:

manadatory

- url - the URL of the player page with all parameters - or
- urlfile - the path to a file that contains multiple such URL that will be used one by one

optional

- stressrate - time interval of adding a new subscriber, in milliseconds
- ttl - lifetime of a subscriber in seconds
- maxsubscribers - maximum number of subscribers

Running tests

1. Start Xorg

```
./start_xorg.sh
```

2. Increase a maximum opened files system limit

```
ulimit -n 1000000
```

3. Start loadtest.sh with chosen parameters

For example,

```
./loadtest.sh -url https://wcs:8888/embed_player?urlServer=wss://wcs:8443&streamName=test&mediaProviders=WebRTC&autoplay=true -maxsubscribers 50 -stressrate 1000 -ttl=300
```

or

```
./loadtest.sh -urlsfile urls.txt -stressrate 1000 -ttl 300 -maxsubscribers 50
```
