HTTP interfaces access restriction

Since build5.2.500the ability was added to restrict access to various HTTP interfaces with the following parameter

 $\verb|http_enable_paths=rest, action, admin, shared, client, client_records, embed_player, empty, health-check | lient_records, empty, lient_records, emp$

By default, all the HTTP interfaces listed in this setting are accessible. To restrict access to web interface but allow access to Ember Player, REST API and server statistics this parameter should be changed as follows

 $\verb|http_enable_paths=rest,action,shared,embed_player,empty,health-check|$

The following interfaces may be restricted:

- rest REST API queries and REST hooks
- action server statistics
- admin server web interface
- shared examples access by generated links
- client examples access by direct links
- client_records recordings access
- enbed_player player access to embed to external web page
- health-check server healt checking interface
