Using and accessing command line

You can get access to core CLI via SSH. To open it you can use a Linux-SSH command line client or any other, for instance, Putty.

```
ssh -p 2001 localhost
username: admin
password: admin
```

In production, change the username and the password to secure ones. The username can be changed in database.yml file, the password can be changes using command line.

Public key authentication is also supported.

Type help in the command line to receive information on commands.

```
login as: admin
SSH server: Password authentication
Using keyboard-interactive authentication.
Password:
% help
Try one of these commands with the -h or --help switch:

NAME    DESCRIPTION
add     Add properties
call    Call commands
reload  Use to reload anything from server
stop    Stop command
passwd  change password
grep    search file(s) for lines that match a pattern
save    Save commands
show    Use to retrieve info from server
start   Start command
update  Update property
remove  Remove property
help    provides basic help
repl    list the repl or change the current repl
```

For a detailed description of a command, you can type that command with the -h key.

```
% update user -h
usage: update [-h | --help] user [-a | --active] <username>

   [-h | --help]   this help
   [-a | --active] set active flag
```
