

# In an iOS mobile application via WebRTC

- [Overview](#)
  - [Operation flowchart](#)
- [Quick manual on testing](#)
- [Call flow](#)

## Overview

WCS provides SDK to develop client applications for the iOS platform.

## Operation flowchart

1. The browser connects to the server via the Websocket protocol and sends the publish command.
2. The browser captures the microphone and the camera and sends the WebRTC stream to the server.
3. The iOS device connects to the server via the Websocket protocol and sends the play command.
4. The iOS device receives the WebRTC stream from the server and plays it in the application.

## Quick manual on testing

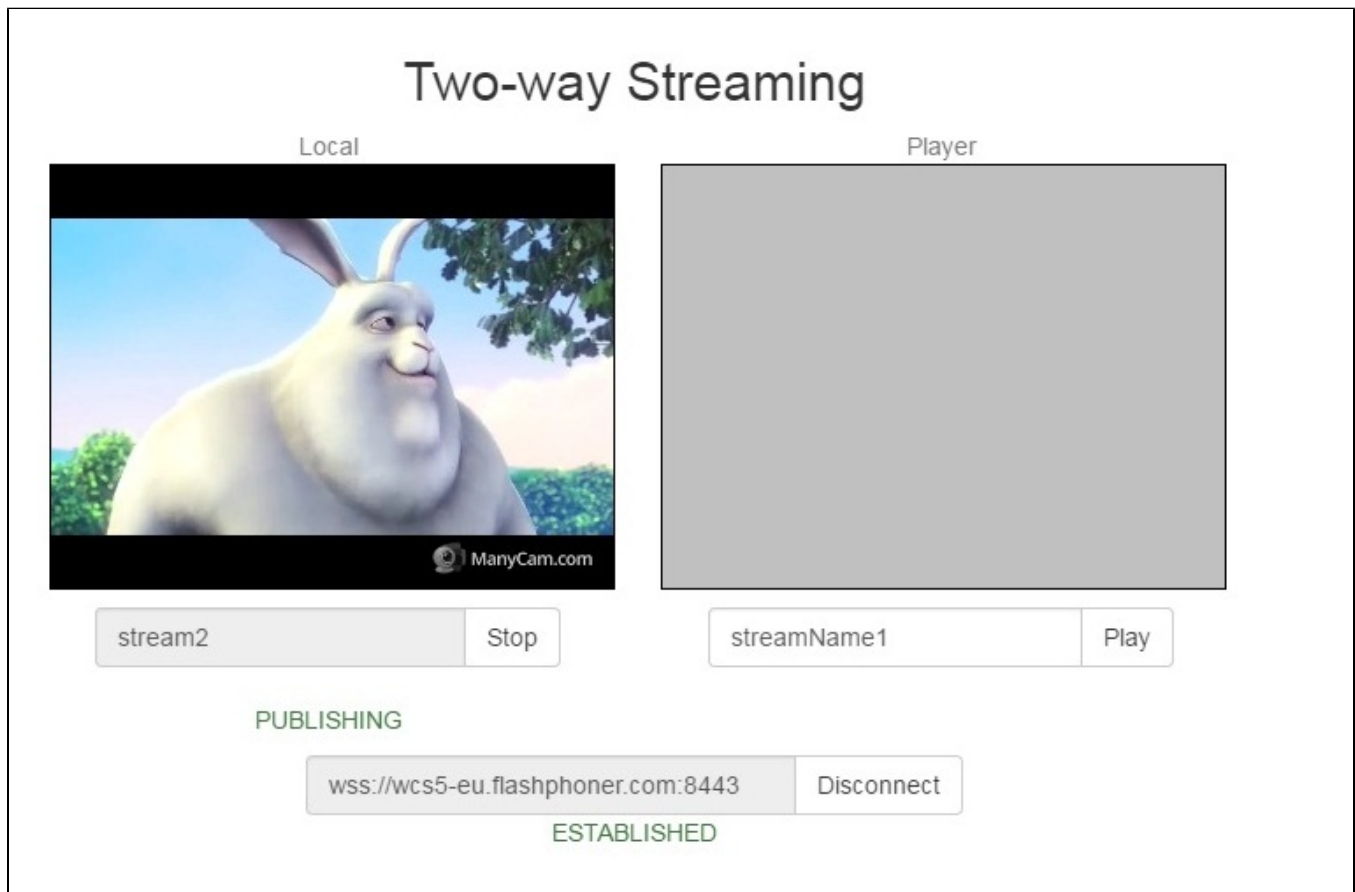

Playing a video stream in an iOS mobile application

1. For the test we use:

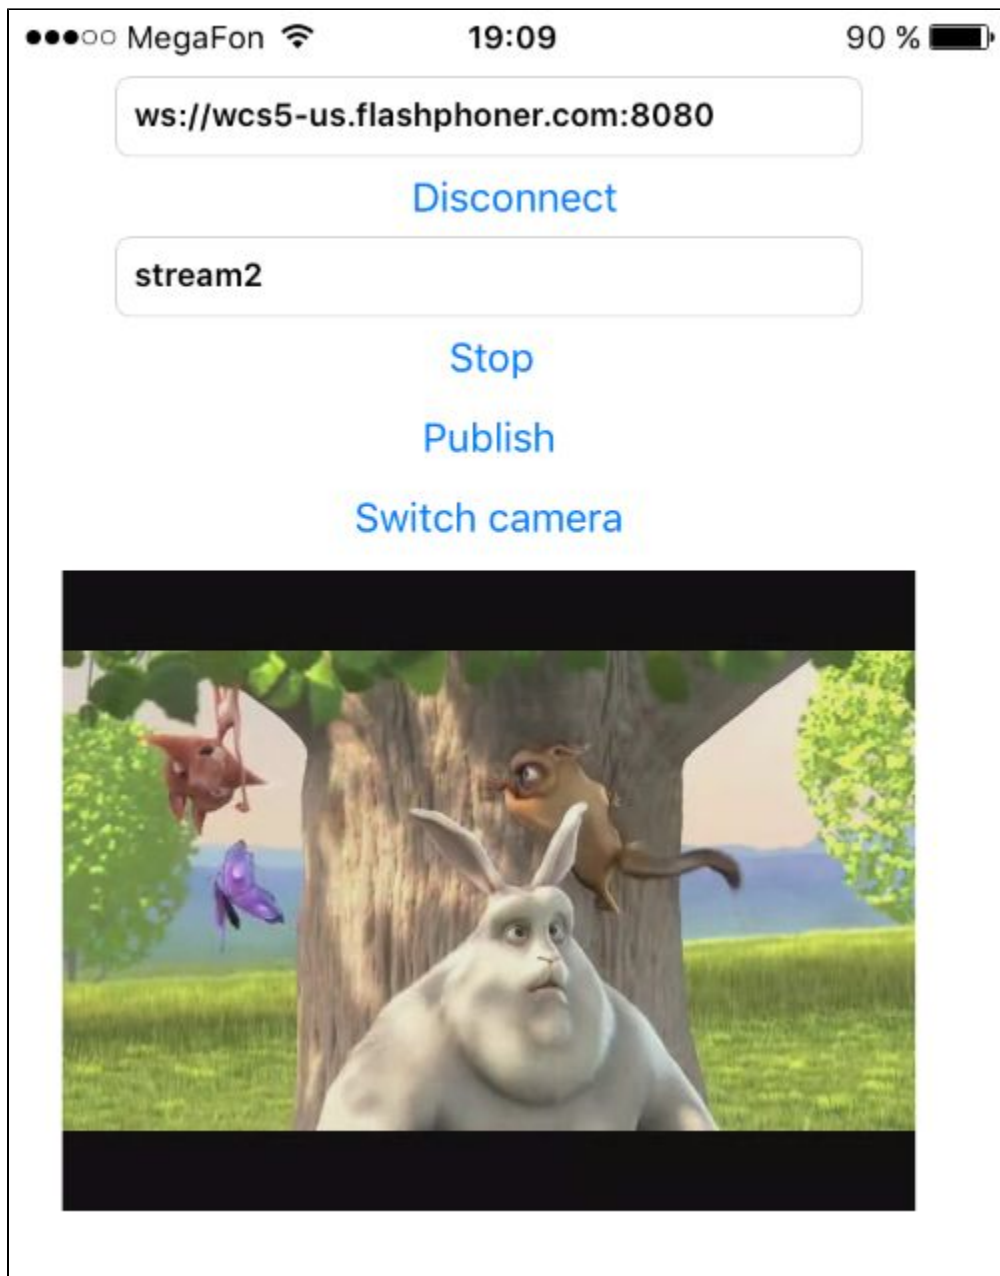

- the demo server at [demo.flashphoner.com](http://demo.flashphoner.com);

- the [Two Way Streaming](#) web application to publish the stream;
- the iOS mobile application to play the stream.

2. Open the Two Way Streaming web application. Click Connect, then Publish. Copy the identifier of the stream:

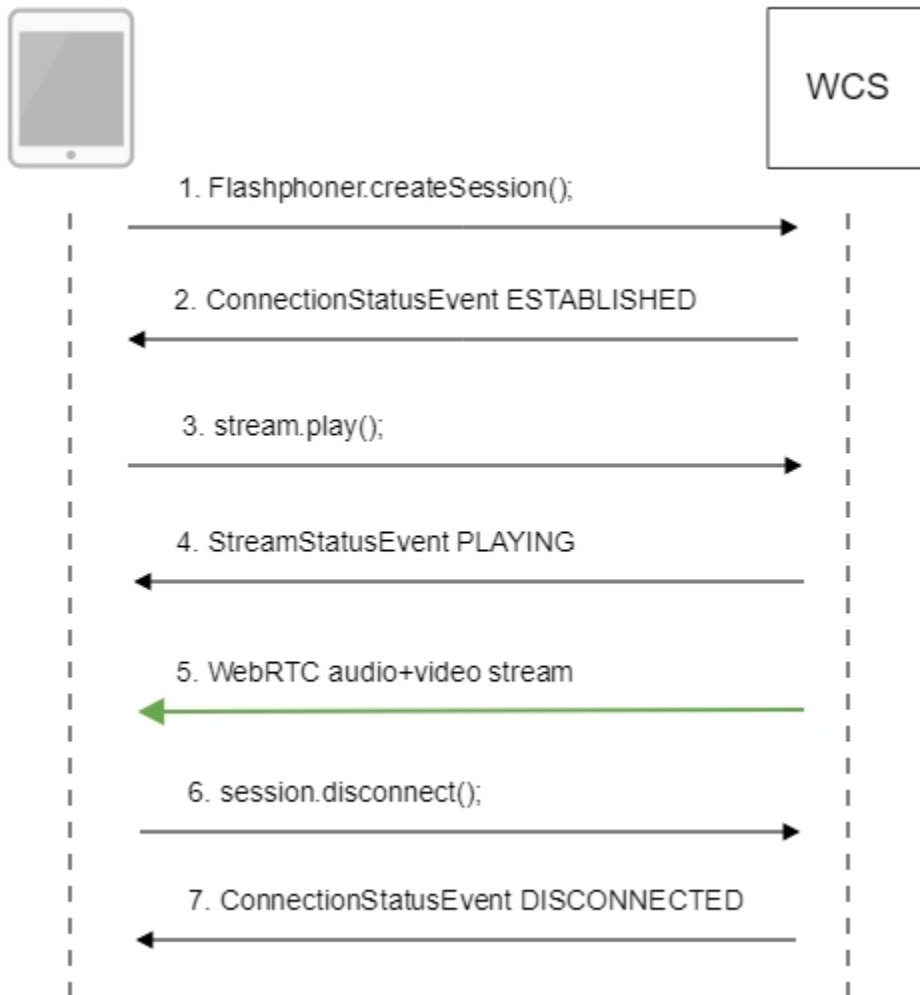

3. Run the application to publish the stream on iPhone. Enter the URL of the WCS server and the name of the published stream, then click "Play". The stream starts playing from the server:

## Call flow

Below is the call flow when using the Player example.

[ViewController.m](#)

1. Establishing a connection to the server.

Flashphoner.createSession();[code](#)

```
FPWCSSessionOptions *options = [[FPWCSSessionOptions alloc] init];
options.urlServer = _connectUrl.text;
options.appKey = @"defaultApp";
NSError *error;
FPWCSSession *session = [FPWCSSession createSession:options error:&error];
```

2. Receiving from the server an event confirming successful connection.

ConnectionStatusEvent ESTABLISHED[code](#)

```
[session on:kFPWCSSessionStatusEstablished callback:^(FPWCSSession *rSession){
    [self changeConnectionStatus:[rSession getStatus]];
    [self onConnected:rSession];
}];
```

3. Playing the stream.

`session.createStream();`[code](#)

```
- (FPWCSApi2Stream *)playStream {
    FPWCSApi2Session *session = [FPWCSApi2 getSessions][0];
    FPWCSApi2StreamOptions *options = [[FPWCSApi2StreamOptions alloc] init];
    options.name = _remoteStreamName.text;
    options.display = _remoteDisplay;
    NSError *error;
    FPWCSApi2Stream *stream = [session createStream:options error:nil];
    if (!stream) {
        ...
        return nil;
    }
}
```

4. Receiving from the server an event confirming successful playing of the stream.

`StreamStatusEvent`, status `PLAYING`[code](#)

```
[stream on:kFPWCSSStreamStatusPlaying callback:^(FPWCSApi2Stream *rStream){
    [self changeStreamStatus:rStream];
    [self onPlaying:rStream];
}];
```

5. Receiving the audio and video stream via WebRTC

6. Stopping the playback of the stream.

`session.disconnect();`[code](#)

```
if ([button.titleLabel.text isEqualToString:@"STOP"]) {
    if ([FPWCSApi2 getSessions].count) {
        FPWCSApi2Session *session = [FPWCSApi2 getSessions][0];
        NSLog(@"Disconnect session with server %@", [session getServerUrl]);
        [session disconnect];
    } else {
        NSLog(@"Nothing to disconnect");
        [self onDisconnected];
    }
    ...
}
```

7. Receiving from the server an event confirming the playback of the stream is stopped.

`ConnectionStatusEvent` `DISCONNECTED`[code](#)

```
[session on:kFPWCSSSessionStatusDisconnected callback:^(FPWCSApi2Session *rSession){
    [self changeConnectionStatus:[rSession getStatus]];
    [self onDisconnected];
}];
```
