

# In an Android mobile application via WebRTC

- [Overview](#)
  - [Operation flowchart](#)
- [Quick manual on testing](#)
  - [Playing a video stream in an Android mobile application](#)
- [Call flow](#)

## Overview

WCS provides SDK to develop client applications for the Android platform

## Operation flowchart

1. The browser connects to the server via the Websocket protocol and sends the publish command.
2. The browser captures the microphone and the camera and sends the WebRTC stream to the server.
3. The Android device connects to the server via the Websocket protocol and sends the play command.
4. The Android device receives the WebRTC stream from the server and plays it in the application.

## Quick manual on testing

### Playing a video stream in an Android mobile application

1. For the test we use:

- the demo server at [demo.flashphoner.com](http://demo.flashphoner.com);
- the [Two Way Streaming](#) web application to publish the stream;
- the Player mobile application ([Google Play](#)) to play the stream

2. Open the Two Way Streaming web application. Click Connect, then Publish. Copy the identifier of the stream:

## Two-way Streaming

Local

6c77 Stop

Player

6c77 Play Available

PUBLISHING

wss://demo.flashphoner.com:8443 Disconnect

ESTABLISHED

3. Install on the Android device the Player mobile app from [Google Play](#). Start the app on the device, and in the "WCS url" field enter the address of the WCS server as `wss://demo.flashphoner.com:8443`, in the "Play Stream" field - the identifier of the video stream:

### Player

WCS Url

`wss://demo.flashphoner.com:8443`

---

Play Stream

`6c77`

START

4. Click Start. The video stream starts playing.

Player

WCS URI  
<wss://demo.flashphoner.com:8443>

---

Play Stream  
**6c77**

---

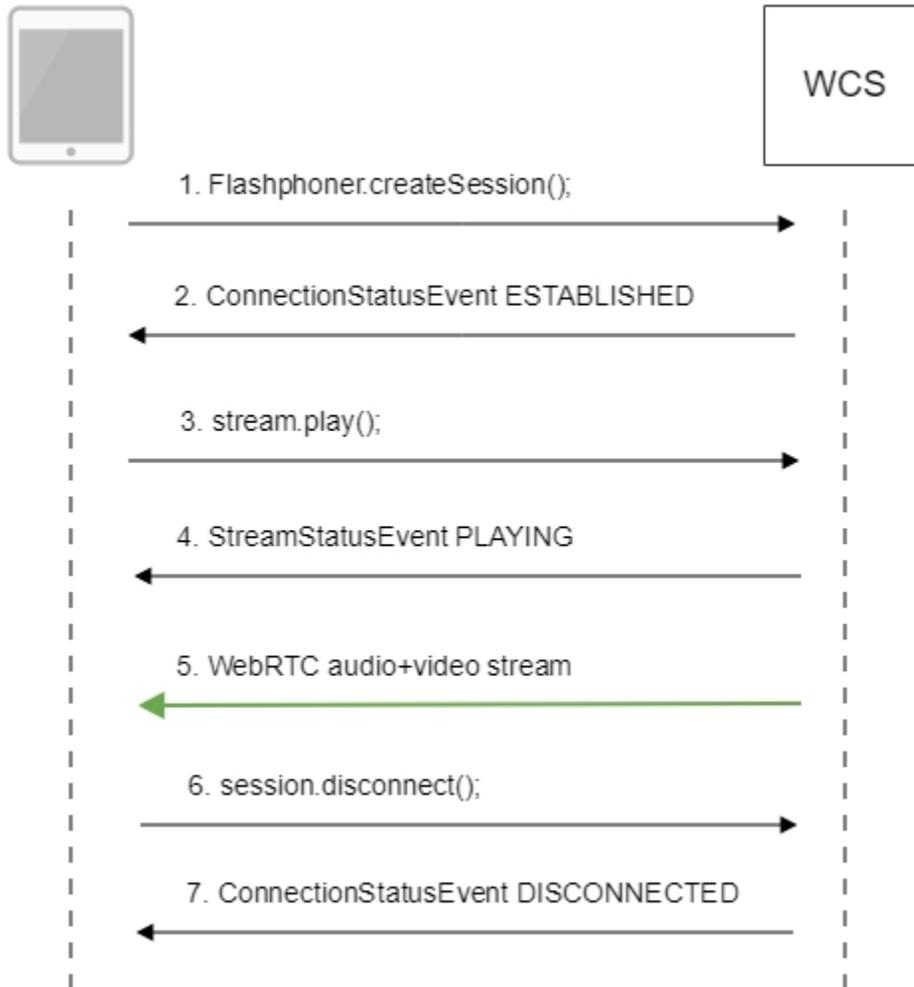

PLAYING STOP

The image shows a video player interface. At the top, the word "Player" is written in white on a black background. Below this is a video player window showing a cartoon pig character. Underneath the video player, the text "WCS URI" is followed by the URL "wss://demo.flashphoner.com:8443". A horizontal line separates this from the text "Play Stream" followed by the stream ID "6c77". Another horizontal line is below this. At the bottom, the word "PLAYING" is centered, and to its right is a grey button with the word "STOP" in white.

## Call flow

Below is the call flow when using the Player example to play the stream.

[PlayerActivity.java](#)

1. Establishing a connection to the server.

Flashphoner.createSession();[code](#)

```

/**
 * The options for connection session are set.
 * WCS server URL is passed when SessionOptions object is created.
 * SurfaceViewRenderer to be used to display the video stream is set with method
SessionOptions.setRemoteRenderer().
 */
SessionOptions sessionOptions = new SessionOptions(mWcsUrlView.getText().toString());
sessionOptions.setRemoteRenderer(remoteRender);

/**
 * Session for connection to WCS server is created with method createSession().
 */
session = Flashphoner.createSession(sessionOptions);
  
```

2. Receiving from the server an event that confirms successful connection.

ConnectionStatusEvent ESTABLISHED[code](#)

```

@Override
public void onConnected(final Connection connection) {
    runOnUiThread(new Runnable() {
        @Override
        public void run() {
            mStartButton.setText(R.string.action_stop);
            mStartButton.setTag(R.string.action_stop);
            mStartButton.setEnabled(true);
            mStatusView.setText(connection.getStatus());

            /**
             * The options for the stream to play are set.
             * The stream name is passed when StreamOptions object is created.
             */
            StreamOptions streamOptions = new StreamOptions(mPlayStreamView.getText().
toString());

            /**
             * Stream is created with method Session.createStream().
             */
            playStream = session.createStream(streamOptions);

```

### 3. Playing the stream.

`stream.play();`

```

/*
 * Method Stream.play() is called to start playback of the stream.
 */
playStream.play();

```

### 4. Receiving from the server an event confirming successful playing of the stream.

`StreamStatusEvent`, status `PLAYING`

```

status.
/**
 * Callback function for stream status change is added to display the
 */
playStream.on(new StreamStatusEvent() {
    @Override
    public void onStreamStatus(final Stream stream, final StreamStatus
streamStatus) {
        runOnUiThread(new Runnable() {
            @Override
            public void run() {
                if (!StreamStatus.PLAYING.equals(streamStatus)) {
                    Log.e(TAG, "Can not play stream " + stream.getName() +
" " + streamStatus);
                } else if (StreamStatus.NOT_ENOUGH_BANDWIDTH.equals
(streamStatus)) {
                    Log.w(TAG, "Not enough bandwidth stream " + stream.
getName() + ", consider using lower video resolution or bitrate. " +
                    "Bandwidth " + (Math.round(stream.
getNetworkBandwidth() / 1000)) + " " +
                    "bitrate " + (Math.round(stream.
getRemoteBitrate() / 1000)));
                } else {
                    mStatusView.setText(streamStatus.toString());
                }
            }
        });
    }
});

```

5. Receiving the audio-video stream via WebRTC

6. Stopping the playback of the stream.

`session.disconnect();`[code](#)

```

} else {
    mStartButton.setEnabled(false);

    /**
     * Connection to WCS server is closed with method Session.disconnect().
     */
    session.disconnect();
}

```

7. Receiving from the server an event confirming the playback of the stream is stopped.

`ConnectionStatusEvent DISCONNECTED`[code](#)

```

@Override
public void onDisconnection(final Connection connection) {
    runOnUiThread(new Runnable() {
        @Override
        public void run() {
            mStartButton.setText(R.string.action_start);
            mStartButton.setTag(R.string.action_start);
            mStartButton.setEnabled(true);
            mStatusView.setText(connection.getStatus());
        }
    });
}

```
