

# HTTP interfaces access restriction

Since build [5.2.500](#) the ability was added to restrict access to various HTTP interfaces with the following parameter

```
http_enable_paths=rest,action,admin,shared,client,client_records,embed_player,em  
check
```

By default, all the HTTP interfaces listed in this setting are accessible. For example, the parameter should be changed as follows to restrict access to web interface but allow access to Ember Player, REST API and server statistics

```
http_enable_paths=rest,action,shared,embed_player,empty,health-check
```

The following interfaces may be restricted:

- `rest` - REST API queries and REST hooks
- `action` - server statistics
- `admin` - server web interface
- `shared` - examples access by generated links
- `client` - examples access by direct links
- `client_records` - recordings access
- `embed_player` - player access to embed to external web page
- `health-check` - server health checking interface
