

Server domain name support as external address

It is allowed to set server domain name as external address in [flashphoner.properties](#) file, for example

```
ip=test.flashphoner.com
```

Also dynamic DNS domains may be used, for example

```
ip=wcs.dyndns.com
```

Anyway, the name should match current external IP address of the server.

While IP address or another DNS record parameters are changing, publishing and playback failures are possible until DNS record update is deployed to all DNS servers.
